

# LEVELMASTER FIBRE PLUS

# Fibre Reinforced, High Performance, Flexible, Self-Levelling Compound

**Technical Data Sheet** 

LEVELMASTER RANGE

CLASS CT-C25-F7

# **Description:**

A high performance, flexible, free-flowing, self-levelling and smoothing cementitious flooring compound. Reinforced with a blend of fibres and polymers to strengthen and improve flexibility. Suitable for use at thicknesses from 3mm to 50mm (up to 60mm with added aggregate). It can be hand or pump applied, is protein-free and can be overlayed with most common floor coverings. Conforms to EN13813:2002.

#### Features & Benefits:

- Polymer enhanced/contains fibres.
- Flexible, self-levelling formula.
- High early strength.
- Can be applied at 3 to 50mm in one layer.
- Pumpable.
- Low odour formulation.
- Suitable for use with underfloor heating.
- Protein-free.
- Internal use.

#### **Uses**

FIBRE PLUS is an ideal underlay for levelling most common internal sub-floors prior to the installation of final wearing surfaces such as ceramic floor tiles, carpet, vinyl, and wood flooring (minimum levelling thickness 3mm). Suitable for use over cement and sand screeds with existing underfloor heating It also contains powdered latex eliminating the need for separate expensive latex liquids.

#### **Substrates**

May be used over:

- Concrete and cement based substrates.
- Calcium sulphate (gypsum) screeds (sanded and vacuumed).
- Properly prepared old ceramic tiles, natural stone, terrazzo.
- Properly prepared old water-resistant adhesive residues.
- New mastic asphalt screeds (sanded), flooring grade (IC10, IC15) with layer thickness 3-5mm.

#### **Preparation**

Sub-floors should be clean, dry, structurally sound and free from grease, oil, paint, polish or other contaminants that may hinder adhesion. Vacuum clean the surface before application of primers or compound. Turn off underfloor heating 48 hours prior to commencing work and switch back on 48 hours after completion, raising the temperature +5°C per day.

• All sub-floors on or below ground level should have an effective damp proof membrane and for subsequent laying of flexible floorcoverings or timber should have a moisture content of 75% RH or below. For moisture levels above 75% RH, a surface damp

proof membrane should be applied.

- **Gypsum and Anhydrite screeds** should always be free from moisture. Do not use surface damp proof membranes on gypsum substrates as a method of controlling moisture content.
- Old ceramic tiles should be thoroughly cleaned and abraded
- Old water-soluble adhesives should be removed completely, and the surface then primed with a waterproof primer such as PRIMER AND FLEXIBLE ADMIXTURE or SBR.
- **Old water-resistant adhesives** should be mechanically removed as far as possible and remaining residue firmly bonded.
- **Absorbent surfaces** such as concrete and cement should be primed with a waterproof primer such as Bond It PRIMER AND FLEXIBLE ADMIXTURE.
- **Non-absorbent surfaces** should be cleaned and primed with a suitable primer. Bond It EXTERIOR PREGRIT is also recommended for this purpose.
- Ceramic should be clean and free from grease before priming.
- Water resistant adhesive residues should be removed as far as possible before priming.
- New sanded mastic asphalt should be vacuumed before priming. Recommended layer thickness over mastic asphalt is maximum 3-4mm
- Wooden floors should be over boarded with 15mm exterior grade plywood rigidly fixed with screws at 300mm centres. Prime as for absorbent surfaces.
- Calcium Sulphate / gypsum screeds should be sanded and vacuumed before priming with 2 coats of Bond It PRIMER AND FLEXIBLE ADMIXTURE and left to dry for 24 hours. If FIBRE PLUS is to be used at thicknesses above 10mm over a gypsum screed (contact Technical Services). Note: Not suitable for use over old mastic screeds. If in doubt contact Technical Services.

#### Mixing

Use 3.6L of clean water for every 20Kg bag of FIBRE PLUS. Slowly add the powder to the water whilst stirring with a suitable heavy duty slow speed drill or paddle. Stir for approximately 3 minutes until a homogeneous lump free mix is formed. Do not overwater!

Foam while mixing, or settling of the sand aggregate while placing, indicates overwatering.

Do not mix more than can be laid in 10 minutes. Never add extra water to this product once it has started to set.

If FIBRE PLUS is bulked with aggregate (aggregate is added last) for layer thicknesses of 10-60mm: approx. 65% wt. clean silica sand (0.1-3.0mm) or clean 3mm granite chippings.

#### **Application**

The temperature of the floor must be >+5°C. Pour the FIBRE PLUS onto the prepared surface and trowel to a smooth finish. Use a flooring trowel or float to promote a smooth surface and smooth out any flow lines. Do not mix more than can be laid in 10 minutes. This product can be laid up to 10-12mm in thin layers, ensuring that the previous layer has fully hardened/ cured. Allow adequate ventilation during curing. When layer thicknesses is above 3mm, contact with vertical surfaces should be avoided by using edging strip. Edge, interior and movement joints in the floor should not be covered with LevelMaster FIBRE PLUS and should be closed with suitable measures. Do not use at temperatures below +5°C. LevelMaster FIBRE PLUS will accept light foot traffic after approx. 3 hours however, soft floor coverings should not be laid for 24 hours.

# **Ready For Covering**

- 3 to 10mm thickness of LevelMaster FIBRE PLUS can be covered with FLEXIBLE floor coverings after approx. 24 hours.
- Up to 50mm thickness over internal concrete and be covered with CERAMIC TILES after approx. 3 hours.
- For non-porous surfaces the following drying times are recommended before application of CERAMIC TILES:
- Up to 10mm 1 day
- 10-20mm approx. 3 days
- 20-30mm approx. 7 days
- 30-40mm approx. 10 days
- 40-50mm approx. 14 days.

# **Limitations**

Do not use at temperatures below +5°C or above +30°C. High temperatures will reduce the open time. Cold or humid conditions will slow the drying times. It is essential that ambient conditions do not exceed 55% RH for at least 28 days after application. Increased levels of humidity can lead to product failure. Do not use externally. We do not recommend use of a spikey roller as this can pull the fibres out. LevelMaster FIBRE PLUS does not provide a final wearing surface and must be covered

with a floorcovering (ceramic tiles, wood flooring or carpet). PVA is not suitable for use as a primer prior to application of smoothing compound.

#### **Cleaning**

All tools and equipment should be cleaned in water. Cured material can only be removed by mechanical means.

#### **Size**

20kg paper sack.

#### Coverage

One 20Kg bag is sufficient to cover approximately 4m<sup>2</sup> at a thickness of 3mm.

#### Colour

Grey powder.

#### **Shelf Life**

12 months from date of manufacture, before the date shown on the bag when stored in unopened sacks.

#### **Storage Conditions**

Keep in unopened, original bags away from extremes of temperature, draughts and in dry conditions. Store clear of the ground at temperatures between +5°C and +30°C. Ensure part-used bags are resealed.

# **Disposal Of Containers**

Do not leave empty containers where residue could be harmful to children, animals or the environment. Remove any bags or used material to a central disposal point in accordance with local regulations.

### **Health & Safety**

Please refer to separate safety data sheet (SDS) for full handling, use and storage instructions. Keep out of reach of children. It is the user's responsibility to determine suitability for use. If in doubt, contact our Technical Department for advice.

Note: this information is for general guidance only, since site conditions and labour are beyond our control.
